

Jet Pilot Harness Installation Hints

1. Try on Jet Pilot (and adjust straps) while sitting in a regular chair before installing in race seat.
2. Velcro on backside of lumbar support helps hold lumbar pad to seat back. If seat is smooth, stick loop half of Velcro to seat back in appropriate area. If seat fabric is rough enough, only the hook side (attached to the lumbar pad) is needed. Simply press firmly into seat to attach.
3. Practice adjustment until 12 second buckle-in is achieved. More importantly practice evacuation procedures until 12 seconds or less to release buckles and exit. Practice evacuation procedure 20 times or until process becomes instinctive.
4. For more installation tips and procedures, check the rear of the pdf catalog or download it at teamtechmotorsports.com

New!! 7th point (crotch) strap helps to hold lap and 6pt leg straps in place, helping to prevent upward movement of the shoulders and head in a rollover or rear impact incident.
